PULAK KANTI PRAMANIK

Java Full Stack Developer · Spring Boot · Angular · React.js · Microservices

9679941138 | pulakkantipramanik50@gmail.com | Bangalore | LinkedIn | GitHub | LeetCode

PROFESSIONAL SUMMARY

Results-driven Java Full Stack Developer with 3.5+ years of professional experience , building enterprise-grade Microservices architectures and responsive frontend UIs across Healthcare and Fintech domains. Specialized in designing complex multi-role workflow systems with Spring Boot, Angular, and React.js, with deep expertise in JWT-based security, Payment Gateway integrations, Webhook processing, and database performance optimization. Known for writing clean, testable code with high coverage and delivering features that have measurable business impact. Immediate joiner actively seeking a challenging Full Stack role in a high-growth environment.

TECHNICAL SKILLS

Languages	Java, JavaScript, SQL
Frontend	Angular, React.js, TypeScript, HTML5, CSS3
Backend	Spring Boot, Spring MVC, Spring Security, JWT , Hibernate, RESTful APIs
Architecture	Microservices, API Gateway, Webhook Processing , Apache Kafka, Resilience4j (Circuit Breaker) , Feign Client
Database	MySQL (Query Optimization, Indexing, Server-Side Pagination), Redis (Caching)
DevOps / Cloud	AWS S3, Git, GitHub, Maven, SonarQube, CI/CD (GitHub Actions / Jenkins) , Docker, Kubernetes (K8s)
Tools	IntelliJ IDEA, VS Code, Postman, JIRA
Testing	JUnit, Mockito, Swagger (OpenAPI)
Methodology	Agile, Scrum

PROFESSIONAL EXPERIENCE

Unizen Technologies — Software Engineer (Java / Full Stack)

Bangalore, India | Nov 2022 – Present | Notice Period: Immediate Joiner

Labcorp – Enterprise Diagnostic Management System

Domain: Healthcare | Role: Full Stack Java Developer | Tech: Spring Boot · Angular · MySQL · Microservices · JWT

Designed and delivered a scalable, Microservices-based Diagnostic Management System to automate the complete lab workflow — from patient registration and sample tracking to report generation and delivery. The platform serves 5+ distinct user roles and handles real-time data exchange between diagnostic labs and healthcare providers through secure RESTful APIs, significantly reducing manual effort and improving diagnostic turnaround time.

- Engineered modular Spring Boot Microservices for the Requester and Reviewer modules, implementing well-defined service boundaries with RESTful API communication, ensuring high data consistency and zero cross-service data corruption.
- Developed feature-rich Angular dashboards with Lazy Loading and route-level JWT Authentication, enabling 5+ distinct roles — Sponsors, Project Managers, Reviewers, Requesters, and User Managers — each with tailored views and access controls.
- Built the complete Reviewer module workflow including request validation, inline commenting, single-step approval and rejection actions, with timestamped audit entries written at each state transition.
- Implemented the Sponsor module backend covering multi-level approval flows, escalation triggers for overdue requests, and final confirmation gating before any request is processed — preventing unauthorized processing.

- Designed the User Manager module supporting full user lifecycle management: account creation, role assignment, activation/deactivation, and granular permission updates without system downtime.
- Created Project Manager APIs for end-to-end project governance — project creation, assignment of reviewers and sponsors, milestone-based status tracking, and deadline management.
- Optimized MySQL query performance by analyzing execution plans and applying targeted indexes on high-frequency columns, cutting Project Status report load time by 30% and improving overall dashboard responsiveness.
- Implemented a comprehensive Audit Logging system capturing Create, Approve, Reject, and Escalate events with user identity, timestamps, and before/after state — providing full workflow traceability for compliance requirements.

Paywize – Fintech Payment Integration Platform

Domain: Fintech | Role: Java Developer | Team Size: 6 | Tech: Spring Boot · React.js · MySQL · Webhooks

Contributed to building a production-grade Fintech Payment Integration platform enabling merchants to securely process Payouts, Collections, and Refunds through REST APIs. The system handles high-volume transactions with real-time Webhook notifications, encrypted communication, and strict financial compliance — serving merchants with zero tolerance for duplicate or failed payments.

- Architected a modular Payment Integration Layer using Spring Boot, with dedicated service layers for Payouts, Collections, and Refund handling — each enforcing strict transaction isolation levels to prevent data inconsistency during concurrent payment processing.
- Engineered an intelligent Retry Logic system with Exponential Backoff and Idempotency Keys, eliminating duplicate transaction processing during network failures and gateway timeouts — ensuring financial data integrity at scale.
- Developed secure Webhook listeners with HMAC-SHA256 signature verification to authenticate and process real-time payment status events from third-party gateways, achieving zero data discrepancy across all payment state transitions.
- Built a responsive React.js Merchant Dashboard that integrates with backend APIs to provide real-time visibility into Payout status, Transaction history, and Refund tracking — improving merchant self-service and reducing support queries.
- Implemented Structured Logging and end-to-end Audit Trails covering the full transaction lifecycle and merchant activity logs, enabling fast incident response and ensuring adherence to financial compliance standards.
- Designed a centralized Error Handling Framework that intercepts raw third-party gateway errors and maps them to standardized, user-friendly messages — significantly improving merchant troubleshooting experience and reducing escalation rate.
- Improved API performance for large transaction history queries by implementing Server-Side Pagination, dynamic Filtering, and optimized DTO projections using complex SQL — reducing payload size and average API response time.
- Achieved 85%+ unit test coverage for all critical payment modules using JUnit and Mockito, reducing regression bugs and increasing release confidence for every sprint deployment.
- Created comprehensive Swagger / OpenAPI documentation and system architecture diagrams, cutting new developer onboarding time by 40% and enabling faster parallel feature development across the 6-member team.

EDUCATION

Bachelor of Technology (B.Tech)

Gargi Memorial Institute of Technology, Kolkata | Graduated: 2022 | CGPA: **8.6**
